

## CAKE Osa/Kalk – Adjusting the Rear-View Mirrors

Tools Required:

14mm Wrench

17mm Wrench

Step 1: Using a 14mm wrench, tighten the mirror to the handlebar clamp firmly.

Step 2: Using a 17mm wrench, loosen the “lock-nut” which will allow the mirror to rotate freely. We do not want the 14mm to loosen during this step, so you may need to hold the securing 14mm in place while you loosen the 17mm.

Step 3: While sitting on the bike, adjust the mirror position to your liking. Hold the mirror in place, and tighten the 17mm locknut. This will lock the mirror in that position.

Step 4: Just using your hands, you can adjust the angle of the mirror to further desired position.

Complete!
